CONDITIONAL ADOPTION INTELLIGENCE

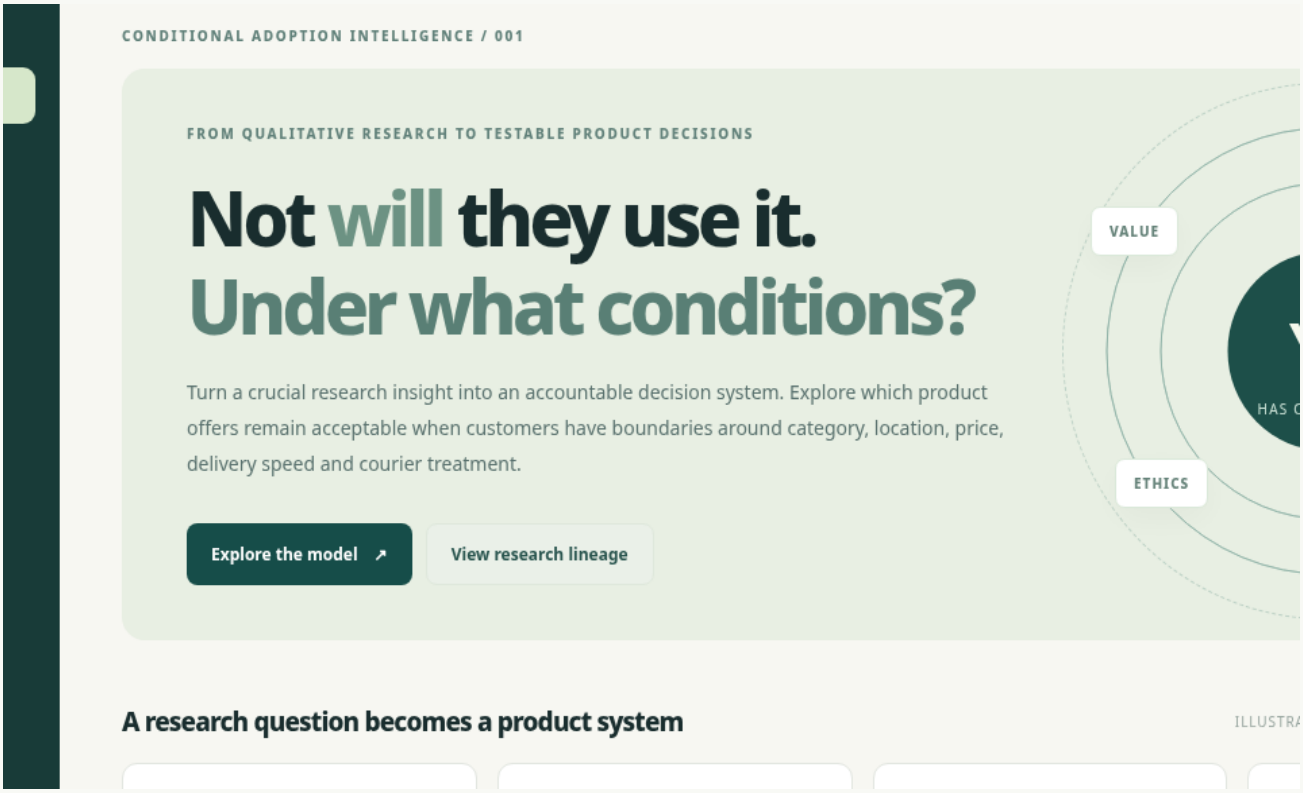

Not will they use it.
Under what conditions?

An interactive research-to-decision laboratory inspired by Salonee's MSc Management work on rapid-delivery adoption. Designed to demonstrate product discovery, operational judgement, stakeholder communication and analytical experimentation.

THE REPORTED QUALITATIVE INSIGHT

After eleven interviews, the study was described as shifting from a yes/no adoption framing to an understanding that acceptability depended on individual conditions: product category, home/work context and treatment of delivery couriers.

THE PROTOTYPE

Interactive web interface: research framing, synthetic scenario metrics and evidence limitations.

How the system works

Reported qualitative themes motivate **testable product requirements**. A deterministic simulator then demonstrates hypothetical trade-offs - without presenting its outcomes as real customer data.

01 Research traceability

Reported claim → product requirement → hypothesis → metric. Each claim includes a limit on what can be inferred.

02 Personal eligibility

Category, context and courier-treatment safeguards act as hard vetoes before any price or speed calculation.

03 Scenario economics

Variable costs, fixed overhead, operational capacity and illustrative interest lead to an explicitly fictional contribution scenario.

04 Constrained decisions

Up to 126 parameter combinations and a Pareto comparison reveal trade-offs under a declared minimum safeguard standard.

05 Experimentation

A/B-test preregistration, approximate sample sizing, primary outcomes and worker-safety guardrails guide next steps.

MODELLING LIMITATION

The 1,200 synthetic profiles and all quantitative thresholds, conversions, price sensitivities and financial outputs are demonstrative assumptions, not dissertation statistics or a real business forecast.

From a model to a defensible test

A research-led product case study should show how a question becomes an experiment - and which claims cannot yet be made.

ILLUSTRATIVE EXPERIMENT DESIGN

Control: Generic fee and ETA disclosure at checkout.
Treatment: Category/context eligibility, fee/ETA and verifiable courier-policy disclosure before checkout.
Primary metric: Completed orders / randomised eligible sessions.
Guardrails: Courier safety, complaints, delivery failures and privacy.

SOURCE & CONTRIBUTION DISCLOSURE

This work was initially generated with AI assistance, based on summaries of Salonee's research supplied in application materials. It does not include original dissertation transcripts. She should verify the research framing and personally test, revise and understand the implementation before attributing technical development to herself.

Next validation step: Compare the source dissertation against the evidence ledger, confirm ethics permissions for any additional research data and replace synthetic assumptions with properly collected, consented evidence before drawing empirical conclusions.
